Historical small-set overfit experiment: all 400 updates

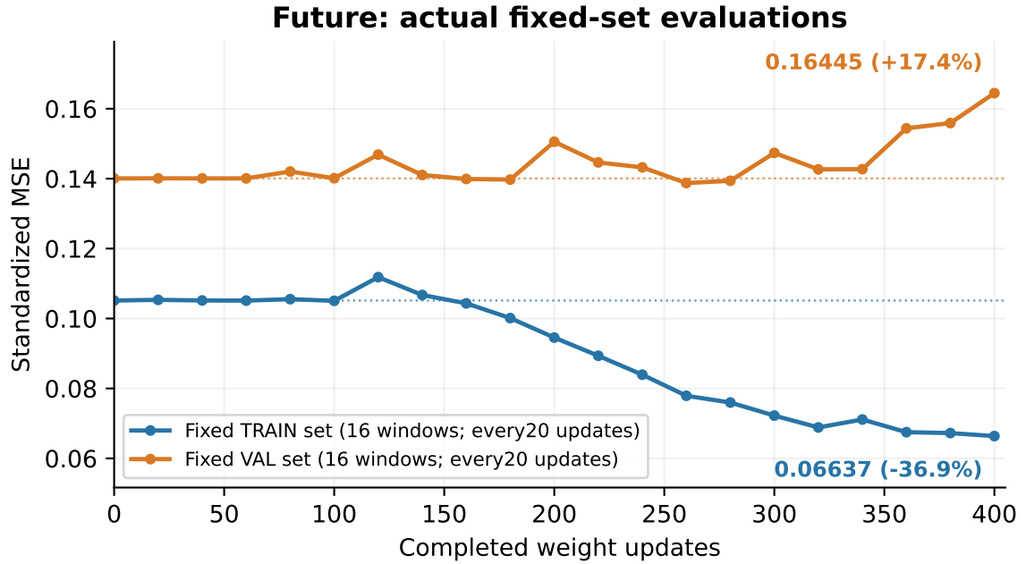

16 fixed TRAIN windows / 2 episodes | 16 VAL windows / 4 separate episodes | B=2 | K=2 | Future weight=9

Future initialized from current DINO; dual quadratic priors; pack2. All MSE values below are unweighted.

Top: every raw batch is shown; batches contain different samples. Red smoothing is explicitly a moving mean.
Bottom: only the 21 real evaluation checkpoints are plotted and connected; no per-update evaluation was recorded.
TRAIN fitting improved substantially late in training; VAL Future worsened. This is not proof of generalization.
